Let K be a compact subset and F be a closed subset in the metric space X. Suppose  $K \cap F = \phi$ . Prove that

$$0<\inf\{d(x,y):x\in K,y\in F\}$$

- 2. Show why the Least Upper Bound Property (every set bounded above has a least upper bound) implies the Cauchy Completeness Property (every Cauchy sequence has a limit) of the real numbers.
- 3. Show that there is a subset of the real numbers which is not the countable intersection of open subsets.
- 4. By integrating the series

$$\frac{1}{1+x^2} = 1 - x^2 + x^4 - x^6 + x^8$$

prove that  $\frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} \cdots$  Justify carefully all the steps (especially taking the limit as  $x \to 1$  from below).

Suppose  $f: \mathbb{R}^2 \to \mathbb{R}$  has partial derivatives at every point bounded by A > 0.

(a) Show that there is an M > 0 such that

$$|f((x,y)) - f((x_1,y_1))| \le M((x-x_1)^2 + (y-y_1)^2)^{1/2}$$

- (b) What is the smallest value of M (in terms of A) for which this always works?
- (c) Give an example where that value of M makes the inequality an equality.
- Suppose  $F: \mathbb{R}^3 \to \mathbb{R}^2$  is continuously differentiable. Suppose for some  $v_0 \in \mathbb{R}^3$  and  $x_0 \in \mathbb{R}^2$  that  $F(v_0) = x_0$  and  $F'(v_0): \mathbb{R}^3 \to \mathbb{R}^2$  is onto. Show that there is a continuously differentiable function  $\gamma, \gamma: (-\varepsilon, \varepsilon) \to \mathbb{R}^3$  for some  $\varepsilon > 0$ , such that
  - (i)  $\gamma'(0) \neq \vec{0} \in \mathbb{R}^3$ , and
  - (ii)  $F(\gamma(t)) = x_0$  for all  $t \in (-\varepsilon, \varepsilon)$ .

- Let  $T: V \to W$  be a linear transformation of finite dimensional real vector spaces. Define the transpose of T and then prove both of the following:
  - i.  $(\{im\}(T))^0 = \{ker(T^t)\}$  where  $(\{im\}(T))^0$  is the annihilator of  $\{im\}(T)$ , the image (range) of T, and  $\{ker(T^t)\}$  is the kernel (null space) of  $T^t$ .
  - ii.  $\{\operatorname{rank}(T)\}=\{\operatorname{rank}\}(T^t)$ , where the rank of a linear transformation is the dimension of its image.
- 8. Let T be the rotation of an angle  $60^0$  counterclockwise about the origin in the plane perpendicular to (1,1,2) in  $\{R\}^3$ .
  - i. Find the matrix representation of T in the standard basis. Find all eigenvalues and eigenspaces of T.
  - ii. What are the eigenvalues and eigenspaces of T if  $\{\mathbf{R}\}^3$  is replaced by  $\{\mathbf{C}\}^3$

[You do not have to multiply any matrices out but must compute any inverses.]

- 9 Let V be a complex inner product space. State and prove the Cauchy-Schwarz inequality.
- Let A be an  $n \times n$  complex matrix satisfying  $A^*A = AA^*$  where  $A^*$  is the adjoint of A. Let  $V = \{C\}^{\{n \times 1\}}$ , the  $n \times 1$  complex column matrices, be an inner product space under the dot product. View  $A: V \to V$  as a linear map. Prove that there exists an orthonormal basis of V consisting of eigenvectors of A, i.e., prove this form of the Spectral Theorem for normal operators.
